     (combine-solutions
       P
       (structural
         (induction P)))]))
```

from 26.3 of How to Design Programs

structural is a special case of general recursion

```
(define topics
 (make-agenda
  '("Recursive Data Type"
    "Structural Recursion"
    "General Recursion")))
```

Things to Consider

- How would we write a tail call version of plus, take, and bundle?
- What would these examples look like in a strongly typed language?
- How did we get around not having to use the Y combinator or a fix point constructor?
